

DMS Frontend Issues Report

Post-GitHub Pull Code Review & Readiness Assessment

Project: DMS (Document Management System)

Scope: frontend/ — Next.js 16 application

Branch reviewed: main (after pull)

Latest commits: Write-off UI, facility rename, notifications UI

Version: 1.0

Table of Contents

1. Executive Summary
2. Critical Bugs
3. Build & Deployment Issues
4. Naming Inconsistencies (Customer vs Facility)
5. Functional Gaps (No Backend)
6. Data & Architecture Issues
7. UI / UX Issues (Minor)
8. Backend Readiness Gaps
9. Priority Summary & Recommended Fix Order

1. Executive Summary

This report documents issues identified in the DMS frontend after pulling the latest changes from GitHub. The UI is substantially complete with mock data. Recent additions include a **Write-off Invoice modal**, renaming **customer** → **facility** on the New Order page, and a **Notifications** UI.

Overall status:

- **2 critical bugs** — broken dashboard link, syntax error
- **2 build/CI issues** — production build fails, ESLint errors
- **5 naming inconsistencies** — customer vs facility labels
- **7 functional gaps** — no backend API or database connection
- 6 minor UI/UX items + 4 backend-readiness notes

Important: No backend API integration exists. All CRUD, auth, write-offs, and file uploads are UI-only (`console.log` or local React state).

2. Critical Bugs (Fix First)

#	Issue	Location	Impact
1	Broken Facilities link — quick action points to <code>/customers</code> which does not exist	<code>frontend/src/app/(dashboard)/dashboard/page.jsx</code>	Clicking "Facilities" on dashboard returns 404
2	Syntax error — double comma <code>},,</code> in <code>quickActions</code> array	<code>frontend/src/app/(dashboard)/dashboard/page.jsx</code> (~line 95)	Potential JavaScript parse/runtime issue

3. Build & Deployment Issues

#	Issue	Location	Impact
3	Production build fails — <code>useSearchParams()</code> not wrapped in <code><Suspense></code>	<code>frontend/src/app/(dashboard)/orders/new/page.jsx</code>	<code>npm run build</code> fails; deployment may fail
4	ESLint fails — 25 errors, 3 warnings	Multiple modals, tables, and pages	CI/lint pipeline fails if enforced

3.1 ESLint error pattern

Most errors: `react-hooks/set-state-in-effect` — calling `setState` directly inside `useEffect` .

Affected file
<code>orders/new/page.jsx</code>
<code>facilities/[FacilityId]/users/page.jsx</code>
<code>components/invoices/WriteOffInvoiceModal.jsx</code>
<code>components/orders/CreateInvoiceModal.jsx</code>
<code>components/orders/CreateXrayInvoiceModal.jsx</code>
<code>components/auth/TwoFactorAuthModal.jsx</code>
<code>components/employees/EmployeeFormModal.jsx</code>
<code>components/employees/MatrixEmployeesTable.jsx</code>
<code>components/orders/OrderNotesModal.jsx</code>
<code>components/orders/reminders/ReminderNotesModal.jsx</code>
<code>components/orders/new-order/SubpoenaPreviewContent.jsx</code>
<code>components/orders/unprocessed/PdfPreviewDrawer.jsx</code>
<code>components/reports/ReportsOrdersTable.jsx</code>
<code>components/ui/ActivityLogModal.jsx</code>
<code>components/ui/UploadDocumentsModal.jsx</code>
<code>CertificateNoRecordsModal.jsx</code> , <code>CoverSheetModal.jsx</code> , <code>XrayCoverSheetModal.jsx</code>

3.2 ESLint warnings (minor)

File	Issue
facilities/[FacilityId]/info/page.jsx	Unused <code>SelectField</code>
orders/unprocessed/page.jsx	Unused <code>Link</code> import
orders/unprocessed/PdfThumbnail.jsx	Unused <code>fileName</code> parameter

4. Naming Inconsistencies (Customer vs Facility)

Partially migrated in recent pull. New Order uses `facility` ; these locations still use old naming:

#	Issue	Location
5	Filter label says " Customer "	<code>components/orders/OrderFilterBar.jsx</code>
6	Dashboard stat card says " Customers "	<code>app/(dashboard)/dashboard/page.jsx</code>
7	Activity report filter uses " Customer " / " All Customers "	<code>app/(dashboard)/reports/activity-report/page.jsx</code>
8	Sidebar icon still named <code>CustomersIcon</code> (label is correct: Facilities)	<code>components/layout/Sidebar.jsx</code>
9	Activity log mock text mentions "customer request"	<code>app/(dashboard)/activity-log/page.jsx</code> (cosmetic)

5. Functional Gaps (UI Exists, No Real Data)

#	Issue	Details
10	No backend API	No fetch, axios, or API routes — all data is mock/seed
11	No database connection	Frontend not wired to MySQL
12	Login / 2FA	UI only; console.log — no real authentication
13	Write-off	Modal works in UI; submit only console.log — not persisted
14	Invoice send / resend	Buttons exist; only console.log
15	File uploads	Subpoena, additional docs, batch scan, facility docs — files stay in browser memory
16	CRUD operations	Create/edit/delete update local state or log only

6. Data & Architecture Issues

#	Issue	Details
17	Duplicate mock data	Same facility/order data repeated across many pages
18	No shared API/data layer	Each page has its own seed arrays
19	No .env / API URL config	No NEXT_PUBLIC_API_URL or similar
20	database/ folder untracked	Schema/PDF docs exist locally only — not in GitHub repo

7. UI / UX Issues (Minor)

#	Issue	Location
21	Parent Company field commented out but still in form state	facilities/new/page.jsx , facilities/[id]/info/page.jsx
22	"Upload Additional Documents" (plural) but only one file input	orders/new/page.jsx
23	Notifications page exists but not in sidebar nav (only topbar modal)	notifications/page.jsx , Sidebar.jsx

8. Backend Readiness Gaps

Items the API must support when backend development starts:

#	Gap	What backend needs
24	Write-off payload defined in UI, no endpoint	POST /api/invoices/write-off
25	orderAction : close_order vs keep_write_off	Map to orders.status = Completed vs Write Offs
26	New Order uses facility slugs (smith, martinez)	API should accept facility_id or resolve slug
27	Write-off supports partial amount	Backend must allow writeoff_amount < amount_due

8.1 Write-off modal payload shape (for API design)

```
{
  mode: "single" | "bulk",
  writeOffType: "full" | "specified",
  orderAction: "close_order" | "keep_write_off",
  amount: number,
  totalDue: number,
  invoices: [{
    id, caseNo, company, due, dueAmount, writeOffAmount, ...
  }]
}
```

9. Priority Summary & Recommended Fix Order

9.1 By severity

Priority	Count	Category
Critical	2	Broken link, syntax error
Build / CI	2	Build fail, ESLint errors
Consistency	5	customer vs facility naming
No backend	7	All features UI-only
Minor	6	UX, untracked docs, small UI gaps

9.2 Recommended fix order

1. Fix dashboard link: `/customers` → `/facilities`
2. Remove double comma `},,` in dashboard `quickActions`
3. Wrap `/orders/new` in `<Suspense>` for production build
4. Rename remaining "Customer" labels to "Facility"
5. Decide: fix ESLint errors or relax rule for modals
6. Commit `database/` folder to GitHub (schema + design docs)
7. Start backend API: Auth → Facilities → Orders → Invoices/Write-off

9.3 What works well (no issues)

- 73 source files — full UI coverage for DMS modules
- Write-off modal aligns with database invoice write-off design
- New Order `facility` field aligns with `orders.facility_id`
- Sidebar routes and main navigation structure are sound
- `npm run dev` runs successfully for local development
